

FastMATCH™

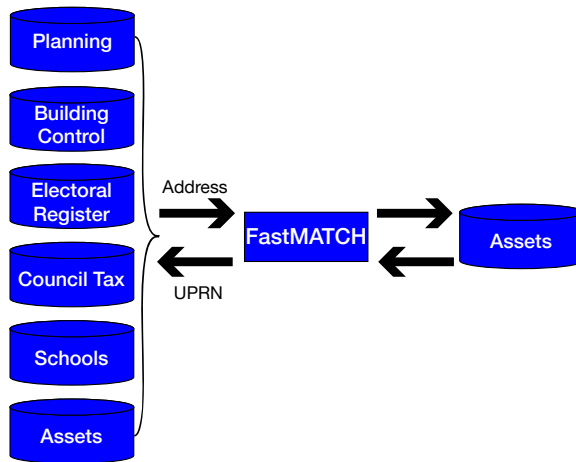

Comprehensive Data Matching Solution

Linking disparate systems to the corporate Local Land and Property Gazetteer (LLPG) is essential to Local Government information management strategies. FastMATCH provides a quick and effective means of cross referencing diverse information sources with the LLPG.

What is FastMATCH™?

FastMATCH is a comprehensive system designed for cross matching address data held in disparate information management systems. It can be used for matching back office systems – such as planning & building control, electoral registers, council tax records, and NDDR's to name but a few, to the LLPG. It can also be used for address cleaning and geocoding against other data such as Ordnance Survey ADDRESS-POINT®.

By searching the LLPG for the most appropriate match, records in the back office system can be linked in to the UPRN for the property. Thereafter, all information systems are able to benefit from a single, corporately maintained LLPG.

What makes FastMATCH™ different?

FastMATCH takes the pain out of cross matching different information sources. Using a sophisticated Database Indexing System (DBI), FastMATCH optimizes search performance on your master address database, and then matches source records using a string comparison algorithm. FastMATCH alleviates the requirement for detailed knowledge of SQL routines or laborious manual processes, and is an effective tool, even if the database structures of source and master records differ. In addition to operating in batch mode, FastMATCH's user interface allows subsequent manual quality assurance.

FastMATCH is available on its own, or as part of the integrated FastSUITE corporate land and property system.

Key Benefits

- Quick to get up and running
- Match unformatted address sets
- Use any address set as master reference
- Batch processing and manual QA options
- Applicable to any ODBC compliant databases (source and master)
