

# FastPORTAL™ for 1APP - Planning Portal Module

Integrating on-line planning with the back office

Delivering successful e-Government initiatives requires effective methods of integrating on-line citizen portals with back office business applications using 1APP. FastPORTAL seamlessly manages the exchange of information between the Planning Portal and Innogistic's FastPLANNING application.

## What is FastPORTAL™?

A standard planning application form in England has now been launched. The new form (1APP) replaces all previous planning application forms (except minerals) within England. This represents a big change to the planning system and a significant step forward in simplifying the planning system. Local Planning Authorities (LPAs) previously produced their own planning application forms varying in format and causing confusion. 1APP improves this system ensuring that the same information is requested by every LPA in England.

Innogistic has taken its successful FastPORTAL module and enhanced it in order that it complies with the new 1APP schema. This allows LPAs to download planning application submissions and attachments from the Planning Portal web site and insert the details into the FastPLANNING database automatically and seamlessly, providing time savings and minimal transcription errors.

## What makes FastPORTAL for 1APP different?

FastPORTAL integrates directly between the Planning Portal and FastPLANNING. Once installed and configured, FastPLANNING operators simply download planning applications into a 'vetting area', where the application can be viewed, checked and submitted into the FastPLANNING application.

FastPORTAL manages all documents uploaded by the applicant – such as the planning permission application form, associated plans (e.g. jpg, bmp etc), and other information passed over in an associated XML file.

Planning Application
